

A private cloud solution is exactly the same as any other cloud computing platform except it is owned and managed easily by you.

Private Cloud Solutions

The technology used to create cloud computing systems are available to everyone. However not everyone has the requirement to run their own cloud computing environment.

There are often specific business requirements for an organisation to own and manage their own computing environment, while still taking advantage of cloud computing.

The most common reason for a business to run a private cloud solution is concerns about security, data protection laws and regulation.

Companies want to know where their data resides, and what regulations apply for privacy and legal access. Globalisation is forcing regulators to review data protection laws.

For other organisations they may be looking for deterministic pricing and un-contended Computing resources.

The Benefits

- [1] Know where your data is located, and which data protection laws apply.
- [2] Make your pricing deterministic by reducing the items that are charged per minute.
- [3] Design a computing environment which adapts around your specific business needs.
- [4] Build a high performance environment without contending for resources with others.

How we can help

We have designed and built private cloud solutions for local authorities, fast food franchises and global road traffic management companies.

Building and running a private cloud solution is not as difficult or expensive as the common perception may lead you to believe.

We can highlight which technologies will suit your business requirements. We can design your private cloud solution for you and train you how to manage it or manage it with you.
